3. General Specifications

- Size: 4.3 inch
- Dot Matrix: 480 x RGBx272(TFT) dots
- Module dimension: 123.5 (W) x 67.2 (H) x 13.05(D)(MAX) mm
- Active area: 95.04 x 53.856 mm
- Pixel pitch: 0.198(H) x 0.198(V) mm
- LCD type: TFT, Normally Black, Transmissive
- Viewing Angle: 80/80/80/80
- Aspect Ratio: 16:9
- Backlight Type: LED, Normally White
- TFT Controller IC: BT816
- TFT Interface: SPI/QSPI
- With /Without TP: Without TP
- Surface: Anti-Glare

4.2. QSPI Interface

The QSPI slave interface operates up to 30MHz. Only SPI mode 0 is supported. The QSPI can be configured as a SPI slave in SINGLE, DUAL or QUAD channel modes. By default the SPI slave operates in the SINGLE channel mode with MOSI as input from the master and MISO as output to the master. DUAL and QUAD channel modes can be configured through the SPI slave itself. To change the channel modes, write to register REG_SPI_WIDTH. The table below depicts the setting.

REG_SPI_WIDTH[1:0]	Channel Mode	Data pins	Max bus speed
00	SINGLE – default mode	MISO, MOSI	30 MHz
01	DUAL	MOSI, MISO	30 MHz
10	QUAD	MOSI, MISO, IO2, IO3	30 MHz
11	Reserved	-	-

Table 1 QSPI Channel Selection

With DUAL/QUAD channel modes, the SPI data ports are now unidirectional. In these modes, each SPI transaction (signified by CS going active low) will begin with the data ports set as inputs.

Hence, for writing to the BT815/6, the protocol will operate as in FT800, with “WR-Command/Addr2, Addr1, Addr0, DataX, DataY, DataZ ...” The write operation is considered complete when CS goes inactive high.

For reading from the BT815/6, the protocol will still operate as in FT800, with “RD-Command/Addr2, Addr1, Addr0, Dummy-Byte, DataX, DataY, DataZ”. However as the data ports are now unidirectional, a change of port direction will occur before DataX is clocked out of the BT815/6. Therefore it is important that the firmware controlling the SPI master changes the SPI master data port direction to “input” after transmitting Addr0. The BT815/6 will not change the port direction till it starts to clock out DataX. Hence, the Dummy-Byte cycles will be used as a change-over period when neither the SPI master nor slave will be driving the bus; the data paths thus must have pull-ups/pull-downs. The SPI slave from the BT815/6 will reset all its data ports’ direction to input once CS goes inactive high (i.e. at the end of the current SPI master transaction).

The diagram depicts the behaviour of both the SPI master and slave in the master read case.

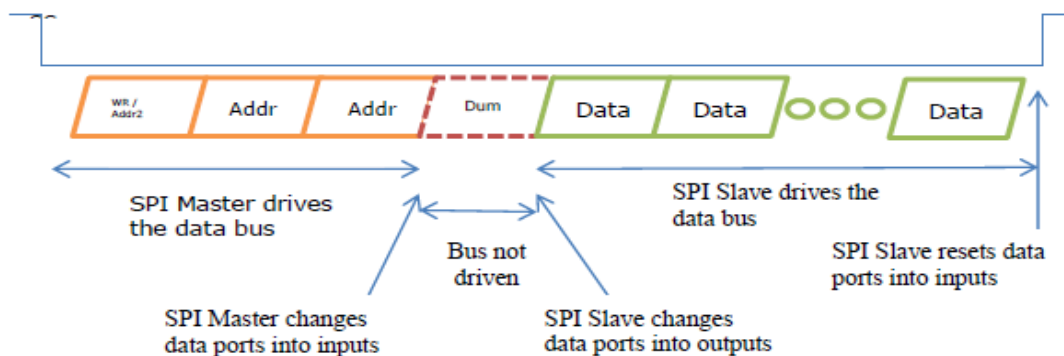

Figure 1 SPI Master and Slave in the Master Read Case

In the DUAL channel mode, MISO (MSB) and MOSI are used while in the QUAD channel mode. IO3 (MSB), IO2, MISO and MOSI are used.

Figure 2 illustrates a direct connection to a 3.3V IO MPU/MCU with single or dual SPI interface.

Figure 3 illustrates a direct connection to a 3.3V IO MPU/MCU with Quad SPI interface.

8.2. Backlight PWM conditions

Parameter	Symbol	Min.	Typ.	Max.	Unit	Remark
PWM Control Duty Ratio	-	0	-	100	%	Note 4,5,6
PWM Control Frequency	-	250	-	10K	Hz	
LED Life Time	-	-	50,000	-	Hr	Note 1,2,3

Note 1 : Ta = 25 °C

Note 2 : Brightness to be decreased to 50% of the initial value

Note 3 : The single LED lamp case

Note 4 : Turn ON the backlight when PWM =Low, Turn OFF when PWM =High

Note 5 : PWM Low Active Control from lowest brightness to highest brightness

Note 6 : Backlight PWM signal is internally connected to BT815/6 backlight control pin, This pin is controlled by BT815/6 registers

Note 7: The backlight dimming control pin (BACKLIGHT) is a pulse width modulated (PWM) signal controlled by two registers: REG_PWM_HZ and REG_PWM_DUTY. REG_PWM_HZ specifies the PWM output frequency, the range is 250-10000 Hz. REG_PWM_DUTY specifies the duty cycle; the range is 0-128. A value of 0 means that the PWM is completely off and 128 means completely on.

The BACKLIGHT pin will output low when the DISP pin is not enabled (i.e. logic 0).

9.2. Internal Regulator and POR(Power-On-Reset)

The internal regulator will generate a Power-On-Reset (POR) pulse when the output voltage rises above the POR threshold. The POR will reset all the core digital circuits ; It is possible to use the PD_N pin as an asynchronous hardware reset input. Drive PD_N low for at least 5ms and then drive it high will reset the BT815/6 chip.

9.3. Power Modes

When the supply to VDD is applied, the internal regulator is powered by VDD. An internal POR pulse will be generated during the regulator power up until it is stable. After the initial power up, the BT815/6 will stay in the SLEEP state. When needed, the host can set the BT815/6 to the ACTIVE state by performing a SPI ACTIVE command. The graphics engine, and the touch engine are only functional in the ACTIVE state. To save power the host can send a command to put the BT815/6 into any of the low power modes: STANDBY, SLEEP and POWERDOWN. In addition, the host is allowed to put the BT815/6 in POWERDOWN mode by driving the PD_N pin to low, regardless of what state it is currently in. Refer to Figure 2 for the power state transitions.

Note 1: Definition of viewing angle range

Fig. 11.1. Definition of viewing angle

Note 2: Test equipment setup:

After stabilizing and leaving the panel alone at a driven temperature for 10 minutes, the measurement should be executed. Measurement should be executed in a stable, windless, and dark room. Optical specifications are measured by Topcon BM-7 or BM-5 luminance meter 1.0° field of view at a distance of 50cm and normal direction.

Fig. 11.2. Optical measurement system setup

Note 3: Definition of Response time:

The response time is defined as the LCD optical switching time interval between “White” state and “Black” state. Rise time, T_r , is the time between photo detector output intensity changed from 90% to 10%. And fall time, T_f , is the time between photo detector output intensity changed from 10% to 90%

Note 4: Definition of contrast ratio:

The contrast ratio is defined as the following expression.

$$\text{Contrast ratio (CR)} = \frac{\text{Luminance measured when LCD on the "White" state}}{\text{Luminance measured when LCD on the "Black" state}}$$

Note 5: Definition of Luminance Uniformity

Active area is divided into 9 measuring areas (reference the picture in below). Every measuring point is placed at the center of each measuring area.

Luminance Uniformity (U) = $L_{min}/L_{max} \times 100\%$

L = Active area length

W = Active area width
