Intel and Pentium are trademarks of Intel Corporation.

Microsoft Windows and MS-DOS are registered trademarks of Microsoft Corp.

All other product names or trademarks are properties of their respective owners.

Product Warranty (2 years)

Advantech warrants to you, the original purchaser, that each of its products will be free from defects in materials and workmanship for two years from the date of purchase.

This warranty does not apply to any products which have been repaired or altered by persons other than repair personnel authorized by Advantech, or which have been subject to misuse, abuse, accident or improper installation. Advantech assumes no liability under the terms of this warranty as a consequence of such events.

Because of Advantech's high quality-control standards and rigorous testing, most of our customers never need to use our repair service. If an Advantech product is defective, it will be repaired or replaced at no charge during the warranty period. For outof-warranty repairs, you will be billed according to the cost of replacement materials, service time and freight. Please consult your dealer for more details.

If you think you have a defective product, follow these steps:

- 1. Collect all the information about the problem encountered. (For example, CPU speed, Advantech products used, other hardware and software used, etc.) Note anything abnormal and list any onscreen messages you get when the problem occurs.
- 2. Call your dealer and describe the problem. Please have your manual, product, and any helpful information readily available.
- 3. If your product is diagnosed as defective, obtain an RMA (return merchandize authorization) number from your dealer. This allows us to process your return more quickly.
- 4. Carefully pack the defective product, a fully-completed Repair and Replacement Order Card and a photocopy proof of purchase date (such as your sales receipt) in a shippable container. A product returned without proof of the purchase date is not eligible for warranty service.
- 5. Write the RMA number visibly on the outside of the package and ship it prepaid to your dealer.

Part No. 2003122102 Printed in Taiwan Edition 3 July 2010

Declaration of Conformity

CE

This product has passed the CE test for environmental specifications when shielded cables are used for external wiring. We recommend the use of shielded cables. This kind of cable is available from Advantech. Please contact your local supplier for ordering information.

CE

This product has passed the CE test for environmental specifications. Test conditions for passing included the equipment being operated within an industrial enclosure. In order to protect the product from being damaged by ESD (Electrostatic Discharge) and EMI leakage, we strongly recommend the use of CE-compliant industrial enclosure products.

FCC Class A

Note: This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference in which case the user will be required to correct the interference at his own expense.

Technical Support and Assistance

- 1. Visit the Advantech web site at www.advantech.com/support where you can find the latest information about the product.
- 2. Contact your distributor, sales representative, or Advantech's customer service center for technical support if you need additional assistance. Please have the following information ready before you call:
 - Product name and serial number
 - Description of your peripheral attachments
 - Description of your software (operating system, version, application software, etc.)
 - A complete description of the problem
 - The exact wording of any error messages

Safety Instructions

- 1. Read these safety instructions carefully.
- 2. Keep this User Manual for later reference.
- 3. Disconnect this equipment from any AC outlet before cleaning. Use a damp cloth. Do not use liquid or spray detergents for cleaning.
- 4. For plug-in equipment, the power outlet socket must be located near the equipment and must be easily accessible.
- 5. Keep this equipment away from humidity.
- 6. Put this equipment on a reliable surface during installation. Dropping it or letting it fall may cause damage.
- 7. The openings on the enclosure are for air convection. Protect the equipment from overheating. DO NOT COVER THE OPENINGS.
- 8. Make sure the voltage of the power source is correct before connecting the equipment to the power outlet.
- 9. Position the power cord so that people cannot step on it. Do not place anything over the power cord.
- 10. All cautions and warnings on the equipment should be noted.
- 11. If the equipment is not used for a long time, disconnect it from the power source to avoid damage by transient overvoltage.
- 12. Never pour any liquid into an opening. This may cause fire or electrical shock.
- 13. Never open the equipment. For safety reasons, the equipment should be opened only by qualified service personnel.
- 14. If one of the following situations arises, get the equipment checked by service personnel:
 - The power cord or plug is damaged.
 - Liquid has penetrated into the equipment.
 - The equipment has been exposed to moisture.
 - The equipment does not work well, or you cannot get it to work according to the user's manual.
 - The equipment has been dropped and damaged.
 - The equipment has obvious signs of breakage.
- 15. DO NOT LEAVE THIS EQUIPMENT IN AN ENVIRONMENT WHERE THE STORAGE TEMPERATURE MAY GO BELOW -20° C (-4° F) OR ABOVE 60° C (140° F). THIS COULD DAMAGE THE EQUIPMENT. THE EQUIPMENT SHOULD BE IN A CONTROLLED ENVIRONMENT.
- 16. CAUTION: DANGER OF EXPLOSION IF BATTERY IS INCORRECTLY REPLACED. REPLACE ONLY WITH THE SAME OR EQUIVALENT TYPE RECOMMENDED BY THE MANUFACTURER, DISCARD USED BATTERIES ACCORDING TO THE MANUFACTURER'S INSTRUCTIONS.
- 17. The sound pressure level at the operator's position according to IEC 704-1:1982 is no more than 70 dB (A).

DISCLAIMER: This set of instructions is given according to IEC 704-1. Advantech disclaims all responsibility for the accuracy of any statements contained herein.

Introduction

1.1 Overview

Advantech's ADAM-4572 and EKI-1221/1222/1224/1221D/1222D series of Modbus Gateways (the following manual will use EKI-122X series instead of complete model name) are a robust, feature-rich, and cost effective way to integrate of Ethernet and Serial Modbus devices. The ADAM-4572 and EKI-122X series provides one, two or four serial ports, one or two Ethernet ports, a wide range of power inputs, and a compact slim design, making them an ideal solution for connecting multiple Modbus/RTU and Modbus/ASCII serial devices to Modbus TCP (Ethernet).

Originally developed for PLCs in industrial automation and manufacturing control applications, Modbus is one of the most popular open standard protocols in use today. The communication mode can be Modbus RTU/ASCII (Serial) or Modbus TCP (Ethernet). Many industrial devices use Modbus as their communication standard. However, the Ethernet-based Modbus protocol is different from the original serial-based protocols that a Modbus Gateway is needed to be a bridge for integration.

The two Ethernet ports allow the EKI-122X series to establish two separated Ethernet connections to two Ethernet domains or two Ethernet switches in the same domain. Through a dual Ethernet connection, the EKI-122X series greatly improves the device connectivity reliability, increase system stability, and simplify the redundant configuration.

The Modbus/RTU and Modbus/ASCII protocols define how a "master" device polls one or more "slave" devices and write real-time data over RS-232, RS-422, or RS-485 serial data communication. The ADAM-4572 and EKI-122X series provides a feature that can allow users to select master or slave operation for each serial port. The ADAM-4572 and EKI-122X series not only allows Ethernet master can control serial slaves, but also allow serial masters to control Ethernet or serial slaves. Furthermore, the EKI-122X series can allow both Ethernet and serial slaves to be controlled by both Ethernet and serial masters.

The ADAM-4572 and EKI-122X series supports various operating modes: RTU Master, RTU Slave, ASCII Master, and ASCII Slave.

1.2 Features

Provides dual 10/100 Mbps auto-sensing Ethernet ports (EKI-122X series only)

2

- Integration of Modbus TCP and Modbus RTU/ASCII networks
- Supports COM port's baud rate up to 921.6 kbps
- Supports up to 16 TCP connections and 32 requests simultaneously
- Supports 31 slaves (RS-485) per serial port
- Supports auto-bypass function (EKI-1221D/1222D only)
- Software selectable RS-232/422/485 communication
- Auto searching slave ID over configuration utility
- Mounts on DIN-rail, wall, or panel
- Class I, Division 2 certificate for EKI-122X series

1.3 Package Check List

ADAM-4572

- 1 x ADAM-4572 Modbus Gateway
- 1 x Document and software CD
- 1 x DIN-rail kit
- 1 x 30 cm 3P to DB9 cable for RS-232 connection

EKI-1221/1222/1224

- 1 x EKI-1221 or EKI-1222 or EKI-1224 Modbus Gateway
- 1 x 6P power connector
- 1 x Document and software CD
- 1 x DIN-rail kit
- 2 x Wall/panel mount kit

EKI-1221D/1222D

- 1 x EKI-1221D or EKI-1222D Modbus Gateway
- 1 x 6P power connector
- 1 x Documents and software CD
- 1 x OPT1-DB9-AE (DB9 to terminal connector)
- 1 x DIN-rail kit
- 2 x Wall/panel mount kit

Please check above items, if any one of them is missing or damaged, contact your sales representative.

ADAM-4572 & EKI-122X Series User Manual

Getting Started

2.1 Understanding Modbus Gateways

Networks have become increasingly vital for industrial automation applications. Many control devices today do not have a network port and can only communicate with a dedicated local PC or control panel. Advantech's revolutionary network-enabling technology is now allowing control devices with serial ports to connect to the Ethernet and share networks quickly and cost-effectively. The ADAM-4572 and EKI-122X series are network-based, Modbus gateways for integrating new and existing Modbus/RTU and Modbus/ASCII serial devices to newer TCP/IP networked-based devices. Manufacturers, system integrators, and end users can now take advantage of Modbus gateways to create networked applications for remote managing and accessing data for their control devices that wasn't possible before.

2.1.1 Protocol Overview

Originally developed for PLCs in industrial automation and manufacturing control application, Modbus has become one of the most popular open standard protocols in use today. When it comes to planning data communication for open, multi-vendor industrial control systems, Modbus is the first choice of end-users and integrators. Although it's not the most powerful protocol available, its rare simplicity allows not only rapid implementation, but also remains flexible enough to be applied in virtually all industrial situations. The communication mode of Modbus can be ASCII, RTU, or TCP/IP. Modbus gateways are used to support applications such as protocol conversion between serial (Modbus/ASCII or Modbus/RTU) and networked (Modbus/TCP) Modbus devices or it can be used to bridge Modbus serial devices over TCP/IP network.

The Modbus/RTU and Modbus/ASCII protocols define how a "master" device polls one or more "slave" devices to read and write real-time data over RS-232, RS-422, or RS-485 serial data communication. The simplicity of Modbus/RTU not only allows rapid implementation, but can also remain flexible enough to be applied in virtually all industrial situations.

During Modbus network communication, the protocol determines how each controller will know its device address, recognize a message addressed to it, determine the kind of action to be taken, and extract any data or other information contained in the message. If a reply is required, the controller will construct the reply message and send it back using Modbus protocol.

The way controllers communicate with each other is by using a master-slave technique, in which only one device (the master) can initiate queries. The other devices (the slaves) respond by supplying the requested data to the master, or by taking the action requested in the query. Typical master devices include host processors and programming panels. Typical slaves include programmable controllers.

It is the master that can address individual slaves and initiate a broadcast message to all slaves. On the other hand, slaves return a response to queries that are addressed to them individually. Responses are not returned to broadcast queries from the master.

The Modbus protocol has a definite format for the master's query, which incorporates the device (or broadcast) address, a function code defining the requested action, any

6

data to be sent, and an error-checking field. The slave's response message, which is also constructed using Modbus protocol, contains fields confirming the action taken, any data to be returned, and an error-checking field. If an error occurred in receipt of the message, or if the slave is unable to perform the requested action, the slave will construct an error message and send it as its response.

The basic system architecture is as below:

Figure 2.1 Modbus System Architecture 1

Figure 2.2 Modbus System Architecture 2

2.1.2 Modbus RTU

The Modbus/RTU protocol defines how a "master" device polls one or more "slave" devices to read and write data in real-time over RS-232, RS-422, or RS-485 serial data communication.

When using RTU mode, each 8-bit byte in a message contains two 4-bit hexadecimal characters. The main advantage of this mode is that its greater character density allows better data throughput than ASCII mode for the same baud rate. Nevertheless, each message must be transmitted in continuous stream.

2.1.3 Modbus ASCII

When using ASCII mode, each 8-bit byte in a message is sent as two ACSII characters. The primary advantage of this ASCII mode is that it allows time intervals of up to one second to occur between characters without causing an error.

Table 2.1: Comparison of Modbus RTU and ASCII Modes		
Mode	RTU	ASCII
Coding System	8-bit binary. Two hexadecimal character contained in each ASCII character of the message	Hexadecimal. One hexadecimal character contained in each ASCII character of the message
Bits per Byte	1 start bit, 8 data bits, 1 bit for even/odd parity; no bit for parity 1 stop bit if parity is used; 2 bits if no parity	 1 start bit , 7 data bits, 1 bit for even/odd parity; no bit for parity 1 stop bit if parity is used; 2 bits if no parity
Error Check	CRC	LRC

2.1.4 Modbus TCP

As a new extension of Modbus/RTU, the Modbus/TCP protocol defines how Modbus/ RTU messages are encoded within and transported over TCP/IP-based networks. Modbus/TCP is just as simple to implement and flexible to apply as the original Modbus/RTU. The Modbus/TCP protocol is defined by its form of encapsulation for a Modbus request or response. That means the Modbus request or response data is encapsulated in TCP frame that has a six-byte header in Modbus/TCP protocol.

Modbus/TCP enables the use of Modbus messaging in an Intranet running the TCP/ IP protocols. Modbus/TCP is most commonly used for Ethernet attachment of PLC's or I/O modules to other simple field buses or I/O networks.

2.2 Specifications

2.2.1 EKI-1221/1222/1224

LAN

Ethernet	10/100 Mbps, RJ45
No. of Ports	2
Protection	Built-in 1.5 KV magnetic isolation

Serial Interface

Interface	RS-232/422/485
No. of Ports	1, 2 or 4
Connector Type	D-Sub 9 male
Parity	None, Even, Odd, Space, Mark
Data bits	7, 8
Stop bits	1, 2
Flow Control	RTS/CTS, XON/XOFF
Speed	50 bps to 921.6 kbps

Signals

RS-232	TxD, RxD, RTS, CTS, DTR, DSR, DCD, RI, GND
RS-422	Tx+, Tx-, Rx+, Rx-, GND
RS-485	Data+, Data-, GND
Protection	15 KV ESD for all signals

Software Features

Operation Mode	Modbus RTU master/slave, Modbus ASCII master/slave
Utility	Serial Device Server Configuration Utility

2.3 Hardware

The following instructions will give the overview of ADAM-4572 and EKI-122X series hardware and its installation.

2.3.1 LED Indicators

There are LEDs display the two sets of power status, system status, dual networks status, and serial communication status on the front panel of ADAM-4572 and .EKI-122X series. Each of them has its own specific meaning as below table.

Table 2.2: EKI-1221/1222/1224, EKI-1221D/1222D LED Indicators				
LED Name	LED Color	LED Description		
D1	Green	Power 1 is on.		
FI	Off	Power 1 is off, or power error condition exists.		
	Green	Power 2 is on.		
FZ	Off	Power 2 is off, or power error condition exists.		
Status	Orange	Blinking: System is ready. Steady on: The device server has been located by utility's locating the device function.		
	Off	System is not working.		
Ethernet	Orange	Blinking: Ethernet port is transmitting or receiving data. Steady on: Ethernet has the good link for 10Mbps or 100Mbps operations.		
	Green	On: 100Mbps Ethernet connection. Off: 10Mbps Ethernet connection.		
	Orange	Serial port is transmitting data.		
Serial	Green	Serial port is receiving data.		
	Off	No data is transmitted or received through the serial port.		

Table 2.3: ADAM-4572 LED Indicators						
LED Name	LED Color	Status LED Description				
	PED	ON	Heartbeat (1 time/sec), system is ready			
Status/Dowor	RED	OFF	System is not working			
Status/FOwer		ON	Power is on			
	GREEN	OFF	Power is off			
	RED	ON	100 Mbps speed			
Spood/Link		OFF	10 Mbps speed			
Speed/Link		ON	Valid network link			
	GREEN	OFF	LED Description Heartbeat (1 time/sec), system is ready System is not working Power is on Power is off 100 Mbps speed 10 Mbps speed Valid network link Invalid network link Data being transmitted No data being transmitted Data being received No data being received			
		ON	Data being transmitted			
Serial	RED	OFF	No data being transmitted			
		ON	Data being received			
	GREEN	OFF	No data being received

2.4 Connecting Hardware

In this instruction, it will explain how to find a proper location for your Modbus Gateways, and how to connect to the network, hock up the power cable, and connect to the ADAM-4572 and EKI-122X series.

2.4.1 Choosing the Location

Due to thier innovative design, ADAM-4572 and EKI-122X series can be:

- Fixed to a panel mount
- Fixed to a DIN-rail

Panel/Wall Mounting

The ADAM-4572 and EKI-122X serie can be attached to a wall using the included metal brackets. Each bracket comes with four screws. You can install the Modbus Gateways firmly via the components, please see the figures below.

Figure 2.27 Combine the Metal Mounting Kit

Figure 2.28 ADAM-4572 Panel Mounting Bracket Dimensions

Figure 2.29 ADAM-4572 Panel Mounting

DIN-rail Mounting

The ADAM-4572, EKI-122X series can be mounted on a standard DIN-rail. The DINrail kit is screwed on the Modbus data gateway when out of factory. If the DIN-rail kit is not screwed on the ADAM-4572, EKI-122X series, please screw the DIN-rail kit on the Modbus data gateway first.

First, hang the Modbus Gateways to the DIN-rail with angle of inclination. See below figure.

Figure 2.30 DIN-rail Step 1

Then, let the Modbus Gateways down straight to slide over the rail smoothly.

Figure 2.31 DIN-rail Step 2

Figure 2.32 DIN-rail Adapter

Figure 2.33 DIN-rail Mounting

2.4.2 Connecting Power

The EKI-122X series supports dual +12 to 48 VDC power inputs and a power-fail relay output. Following figure is the power terminal block pin assignments. Please refer it to connect to the proper power requirements and polarity.

Figure 2.34 Power Connector

You can connect an alarm indicator, buzzer or other signaling equipment through the power-fail relay output. The relay opens if power input V1 or V2 fails. ("Open" means if you connect relay output with an LED, the light will be shut off)

2.4.3 Connecting Serial Devices

The EKI-122X series provides one, two or four standard serial ports DB9 (male) connectors. RS-232/422/485 pin assignments are as below.

Figure 2.35 EKI-122X series Serial Port Pin Assignments

Pin	1	2	3	4	5	6	7	8	9
RS-232	DCD	RX	ТΧ	DTR	GND	DSR	RTS	CTS	RI
RS-422	TX-	-	-	TX+	GND	-	RX+	-	RX-
RS-485	Data-	-	-	Data+	GND	-	-	-	-

2.4.4 Connecting to a Host or the Network

The EKI-122X series provides two RJ45 connectors with dual independent Ethernet networks, and supports 10/100 Mbps transmission speed. The ADAM-4572 and EKI-122X Series will auto detect current transmission speed on the network and configure itself accordingly. For normal operation, the ADAM-4572 and EKI-122X Series can be connected to other hubs or switches through a twisted-pair straight through the Ethernet cable. For configuration or troubleshooting purposes, user may need to connect the ADAM-4572 and EKI-122X Series directly to the host PC. In this operation mode, user can use a crossover Ethernet cable to connect the ADAM-4572 and EKI-122X Series to the host PC's Ethernet connector.

For advanced model, EKI-1221D and EKI-1222D, provide two Ethernet ports with one IP address. One port can be used to connect to the network, and the other port can be used to connect to another Ethernet device (or another EKI-1221D/1222D, like Daisy-Chain structure).

2.4.5 ADAM-4572 Serial Port Wiring

We recommend that shielded-twisted-pair cables that comply with the EIA RS-485 standard be used with the ADAM network to reduce interference. Only one set of twisted-pair cables is required to transmit both Data and RTS signals. We advise that the following standard colors (as indicated on the modules) be used for the communication lines:

Data+ (Y) -> Yellow Data- (G) -> Green

Wiring for RS-232 Connection

Configuration

3.1 Installing the Configuration Utility

The following section will show you how to install Advantech Serial Device Server Configuration Utility, a tool to set up and monitor the Modbus Gateways.

- Note Be sure the Microsoft .NET Framework on your host PC is greater than version 2.0.
- 1. Insert the Advantech IEDG Series Driver Utility CD-ROM into the CD-ROM drive (e.g. E:\) on the host PC.
- Use Windows explorer or the Windows Run command to execute the setup program, the path for the setup program on the CD-ROM should be: E:\Utility&Driver\SerialDeviceServerConfigurationUtility\Serial_Device_ Server_Configuration_Utility_[Version]_Release_[date].exe
- 3. If there is an existed COM port mapping utility on the host PC, you have to remove it and reboot, then go on installing.

4. Once the InstallShield Wizard starts running, click "Next" when the welcome window opens to proceed with the installation.

5. Carefully read the Software License Agreement, and press "I Agree" to continue.

X Advantech Serial Device License Agreement Please review the license terms	Server Configuration Utility Setup before installing Advantech Serial Device Server Configuration Utility.	
	Press Page Down to see the rest of the agreement. ADVANTECH AUTOMATION CORPORATION LICENSE AGREEMENT YOU SHOULD CAREFULLY READ THE FOLLOWING TERMS AND CONDITIONS! Opening and using the enclosed software for any purpose indicates your acceptance of the terms and conditions of this License Agreement. 7. After few minutes, a message will indicate that Configuration Utility is successfully installed, click "Finish" to exit the InstallShield.

3.2 Starting the Configuration Utility

Advantech provides an easy-to-use configuration utility to configure your Modbus Gateways through an Ethernet connection. For secure administration, it can also restrict the access rights for configuration to only one host PC to enhance network security. With this secure function enabled, other PCs will not have permission for configuration. After the installation program on the Advantech IEDG Series Driver Utility CD-ROM is finished, the serial device servers will be ready for use and configure.

You may open the Serial Device Server Configuration Utility from the Windows Start Menu by clicking Start \rightarrow All Programs \rightarrow Advantech eAutomation \rightarrow Serial Device Server Configuration Utility. The Serial Device Server Configuration Utility will appear as below figure.

There are four major areas in the new Serial Device Server Configuration Utility.

- 1. Serial Device Servers List Area: All devices will be searched and listed in this area. You can arrange different favorite group and virtual COM ports.
- 2. Serial Device Servers Information Area: Click on the devices or move cursor to the devices, the related information will be shown in this area.
- 3. Configuration Area: Click on the items on the Serial Device Sever List Area, the configuration page will be displayed in this area.

3.3 Discovering Modbus Gateways

3.3.1 Auto Searching

Advantech Serial Device Server Configuration Utility will automatically search all the EKI, ADAM and EDG series device servers on the network and show them on the Serial Device Server List Area of the utility. The Utility provides an auto-searching function to show your device(s) by simply executing the configuration utility program from the *Start Menu*.

From here all devices on the same network domain will be searched and display on the Serial Device Server List Area. You can click on the device name to show the features of the specific device. Click on the "+" before the model name (e.g. EKI-1224), and the utility will expand the tree structure to show the individual device name. Click on the "-" before the model name (e.g. EKI-1224), and the utility will collapse the tree structure.

For example, EKI-1224 in this figure is shown "EKI-1224-A6A1D4" after expending the tree structure.

Note When you configure the device for the first time, the default device name is "MAC ID". In this case, the device name "EKI-1224-A6A1D4" means the device's Mac ID is "00 D0 C9 A6 A1 D4". You can change the device name in System Tab of Device Property. Select the device in this sub-tree. The first tab on the "Configuration Area" shows the summary of "Basic Information" included device type, firmware version, and device name, "Ethernet Information", and "Serial Port Information". In the serial port information frame, it displays the operation mode, status and connected host IP.

3.3.2 Clear Device List and Search Again

You can click the "Clear Device List and Search Again" button on the Quick Tool

Bar *method* and the utility will clear all list device servers in the Serial Device Server List Area and re-search again. Don't use this function frequently, or the warning message will be pop-up.

You also can click the "Search Again" button on the Quick Tool Bar 2011 and the utility will search serial device servers on the local LAN.

3.3.3 Manual Appending

Using "Add IP address to Favorite" or "Search a Range of IP addresses" functions, you are allowed to add one device or group of devices to "Favorites". These devices can locate on local network domain or other network domain.

3.4 Setting Ethernet Parameters

Click on the "+" before the model name (e.g. EKI-1224), and the utility will expand the tree structure to show the individual device name. And clink on the "+" before the device name, and utility will expand the communication interfaces on this Modbus data gateway. Select the Ethernet interface (Eth1 or Eth2, these are two individual Ethernet ports).

MAC Address:

The MAC address is for the local system to identify and locate each serial device servers. This MAC address is already set before delivery from factory, hence no need for further configuration.

IP Address, Subnet Mask, Default Gateway:

The IP address identifies your Modbus data gateway on the global network. Each ADAM-4572, EKI-122X series has the same default IP address 10.0.0.1 and 10.0.0.2 for dual Ethernet ports. Obtain these specific IP addresses from your network administrator and then configure each Advantech Modbus gateway with individual IP addresses, related Subnet Mask and Gateway Setting.

3.5 Setting Serial Communication Parameters

Click on the "+" before the model name (e.g. EKI-1224), and the utility will expand the tree structure to show the individual device name. And click on the "+" before the device name, and the utility will expand the interfaces on this device server. Select the serial interface. (Port1 to Port4 on e.g. EKI-1224)

3.5.1 Basic Configuration

Description:

You can give a more detailed description on the function of the port for easier management and maintenance. Descriptions have a limit of 128 characters.

Basic	Operation		
Descr	iption	Modbus RTU device Port1	
Туре		RS-232	•
Baud	Rate	9600	•

Type:

The EKI-122X series offers 3 kinds of serial interfaces, RS-232, RS-485 and RS-422. You can use any one of these serial interfaces according to your requirements. You must also pay special attention to the wiring scheme of the EKI-122X series serial connection to make sure it conforms to the serial type you select.

Basic Operation	
Description	Modbus RTU device Port1
Туре	RS-232
Baud Rate	RS-232 RS-422 RS-485
Parity	None

Baud Rate:

The EKI-122X series supports baud rate from 50 bps to 921.6 Kbps. While setting the baud rate, please note that the value should conform to the current transmission speeds of connected devices.

Baud Rate	9600	•
Paritu	14400	^
1 dity	38400	
Data Bits	115200	_
o. p:	230400	Ξ
Stop Bits	921600	~

Parity, Data bits, Stop bits:

The settings for these parameters depend on the protocol that is running on the connected Modbus device (i.e. Modbus/ASCII or Modbus/RTU).

Parity	None	Even or Odd
Data bits	7	7
Stop bits	2	1

Modbus/ASCII

Parity	None	Even or Odd	
Data bits	8	8	
Stop bits	2	1	

Modbus/RTU

Flow Control:

The EKI-122X series provides four options: None, XOn/XOff, RTS/CTS, and DTR/ DSR.

Data Bits	8	•
Stop Bits	1	•
Flow Control	None None X0n/X0ff RTS/CTS DTB/DSB	•

3.5.2 Operation Configuration

The Operation tab is for each serial port's operation mode configuration. The operation mode determines whether the devices that are connected to the serial port will operate as a master or a slave, and whether the Modbus RTU or Modbus ASCII protocol will be used.

Modbus	Slave	Mode:
--------	-------	-------

Advantech Serial Device	Server Configuration Utility

Type:

This option specifies whether the Modbus RTU or Modbus ASCII slave devices are connected to the serial port.

Modbus Timeouts (ms):

This option specifies the time duration in milliseconds for the EKI-122X series to wait for a response after it has issued a command while using Modbus/RTU or Modbus ASCII. After the timeout is expired and no response is received, the EKI-122X series will regard the command as failed. Note that the timeout for the host PC must be greater than the timeout setting here specified, otherwise an error will occur.

ASCII Character Timeouts (ms):

This option specifies the time interval in milliseconds between characters within the Modbus/ASCII message. If a greater interval occurs, the receiving device assumes an error has occurred.

Slave ID Information (EKI-122X Series Only)::

The EKI-122X series features an excellent function that the utility will scan slave ID automatically. Click "Scan Slave ID" button, and the utility will start to issue the requests to the devices connected to this serial port and wait the reply about slave ID information. Alternative option, the utility allows to manual add or delete slave ID information.

Allow any IP access:

The default option, any Modbus TCP device can communicate with this Modbus data gateway.

Specified IP which can access:

Type the IP address in the column and click "Add" or "Delete" button to make the accessible IP address list. The limit of this list is 32 IP addresses.

3.7 Monitoring Modbus Status

Configuration utility provides an excellent function that allows monitoring the serial ports' status. It will present each serial port's operation mode and status. The IP address of the Modbus TCP device which is communicating with serial port will be list on the right window. Click "Refresh" button, the status will be refresh once. It will be auto refresh after click "Auto Refresh" and the time duration is depending on the setting (the default value is 1000ms).

Click "Unlock Device" to unlock the Modbus data gateway, and you need to fill in the password you have set up before. If you forgot the password, the only way to solve this problem is to restore the setting of the Modbus data gateway to the factory default which will be introduced next section.

If you want to disable this function or change the password, click "Change Password" to change the password to default "None" (leave the new password and confirm new password columns blank) to disable this function or other password you want to change. Be sure to click "Reset Device" to restart the Modbus gateway and store the new password into the memory.

3.8.4 Restore to Factory Default Settings

The configuration utility provides this function to let you can restore the Modbus data gateway to factory default settings. The confirm message will be pop-up while clicking "Restore to Factory Default Settings". If you really want to restore the Modbus data gateway to factory default settings, please click "Yes" button to continue.

Please o	onfirm
2	Are you sure to reset the device setting to the factory default?
	<u>[Yes</u>] <u>N</u> o

Then, please power off the Modbus data gateway within ten seconds, after reconnecting the power back, the all setting will be reset to the factory default. If the power remains more than ten seconds, the Modbus data gateway will not have any changes.

3.8.5 Update Firmware

Advantech continually upgrades its firmware to keep up with the ever-expending world of computing. You can use the update firmware function in the utility to carry out the upgrade procedure. Please access Advantech's website: <u>http://www.advantech.com</u> to download the latest version of the firmware.

1. Right click on the device name and select "Update Firmware" function.
